

COMPLETETECH LLC
SERVICES ORCHESTRATION

Engagement Orchestration Overview

Worked example: Northwind Trading Co. pilot

DOCUMENT	DATE	ENGAGEMENT
ORCH-2026-001	2026-05-24	Support triage pilot

Demonstration artifact generated with realistic placeholder data — not a real client engagement.

Engagement Orchestration Overview

Worked example of the CompleteTech LLC agentic services lifecycle for one engagement: the Northwind Trading Co. Customer Support Email Triage Agent pilot. The orchestrator owns state, routing, sequencing, handoffs, and approval gates; specialist skills own their artifacts.

01 | Lifecycle Routing

Stage	Skill	Artifact produced	Gate before next
Discovery	discovery	Requirements brief (DISC-2026-0117)	Facts verified
Proposal	proposal	Pilot proposal (PRO-2026-0188)	Commercial approval
Contract	contract	Agreement (ADSA-2026-0142)	Signature + deposit
Delivery	delivery	Launch readiness checklist	Security signoff
Overlay	security review	Signoff memo (SEC-2026-0090)	Conditional GO
Support	customer success	Health scorecard & QBR	Renewal decision
Proof	case study	Named case study (approved)	Public-use approval
Billing	invoice	Milestone invoice (INV-2026-0461)	Billing approval
Comms	email	Outbound sequence	Verified recipient
Packaging	envelope	#10 addressed envelope	Approved to send

02 | Example project_state Handoff

The orchestrator passes a compact state object between skills and uses TBD for unknowns rather than inventing facts.

Field	Value
client	Northwind Trading Co.
workflow	Support email triage agent
lifecycle_stage	delivery
approvals.commercial	approved

Field	Value
approvals.security	conditional (R-03 open)
approvals.external_send	unknown
next_skill	security-review → delivery
next_action	Close R-03, then run acceptance demo

03 | Routing Logic

- Select the earliest missing lifecycle artifact unless the user requests a specific support output.
- Invoke security review before launch, new tools, external actions, billing, or public proof.
- Use email only for message copy; use envelope only for packaging and delivery-readiness.
- Return a handoff package: artifact paths, decisions, open questions, blockers, approvals, next owner.

04 | Boundary Reminders

- Discovery facts are not a proposal; a proposal is not a contract; a contract does not authorize launch.
- Case studies, testimonials, and named references require verified client approval.
- Certificates require verified recipient/course facts and are not delivery acceptance or public proof.

05 | Messy Real-World Scenario

During delivery, Northwind asks whether the pilot can recommend refunds. The signed scope excludes refund decisions, so the orchestrator keeps the current delivery track inside the approved support-triage scope and opens two parallel draft-only tracks.

Track	Status	Owner	Blocker
Delivery	Active	CompleteTech delivery lead	Launch waits on retention policy
Security review	Blocked	TBD	Security contact and refund-policy risk unknown
Change order	Draft only	CompleteTech engagement lead	Commercial approval for refund recommendations missing

The prior security approval remains conditional for the original pilot only. Refund-related delivery, billing, contract updates, and external send stay blocked until commercial, legal, billing, security, and recipient approvals are current.

06 | Recovery Action

- Keep the pilot sandboxed and inside approved support-triage scope.

- Ask the sponsor whether refund recommendations should become a formal change order.
- Route refund data, policy access, and tool permissions to security review before any implementation.
- Mark any expanded-scope approval as `requested` or `conditional`, never approved, until evidence names the approver and permitted action.
